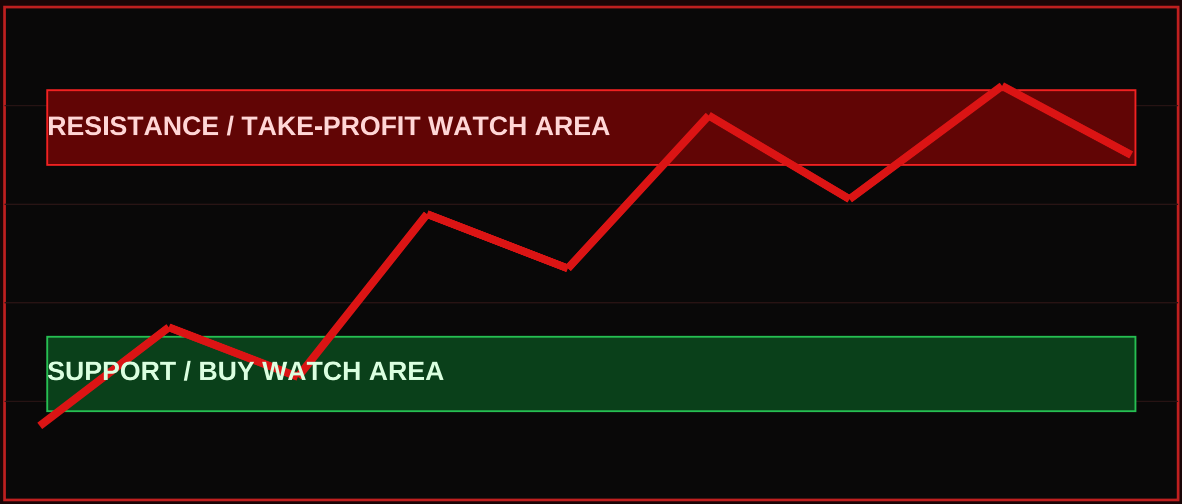
FELIX CRYPTO EDGE

Trading for Dummies

A simple visual beginner guide for reading crypto charts, planning trades, avoiding FOMO, and understanding risk.



Version 0.2 visual draft

Read This First: Risk Disclaimer

This product teaches chart-reading structure. It does not tell you what to buy or promise results.

Education only

!

This guide is not financial advice, investment advice, trading advice, tax advice, or a guarantee of profit. Examples are fictional and simplified.

Crypto is risky

!

Prices can move quickly, exchanges can fail, liquidity can disappear, and you can lose some or all money you trade.

The tool is not a crystal ball

!

Felix Crypto Edge can help you organize a process. It cannot predict the future and cannot remove risk.

Beginner promise: before you place any real trade, know where you are wrong, how much you can lose, and why the setup makes sense. If you cannot answer those points, skip it.

What You Will Learn

A plain-English path from chart basics to a repeatable practice routine.

1. What crypto trading really is
2. Beginner mindset
3. Candlesticks
4. Support and resistance
5. Trends and market structure
6. Timeframes
7. Volume, moving averages, RSI
8. Entries, exits, stops, targets
9. Position sizing and risk
10. Planned long example
11. When to skip a trade
12. Felix Crypto Edge workflow
13. Checklist
14. Mistakes
15. Glossary
16. 7-day practice plan

What Crypto Trading Really Is

Trading is not guessing. It is planning, managing risk, and accepting uncertainty.

1

Not a prediction game

A trader does not need to know the future. A trader needs a plan for what to do if price moves either way.

2

Repeatable process

Look for trend, zones, entry reason, invalidation, risk, and reward in the same order every time.

3

Losses are normal

Even good setups can fail. The goal is to keep losses small enough to continue learning.

4

No guarantees

No indicator, tool, or signal provider can guarantee profit in crypto markets.

OK

Dummy rule

If you cannot explain the trade in one simple sentence, you probably do not have a trade yet.

The Beginner Mindset

Most beginners lose because they rush. Slow decisions are usually better decisions.

1 Survival first

Do not blow up the account. A small account that survives can learn; a destroyed account cannot.

2 Structure second

Use the same checklist every time so you can improve your process instead of reacting randomly.

3 Learning third

Review what happened after each practice setup. Ask what you saw, what you missed, and what to improve.

4 Emotion control

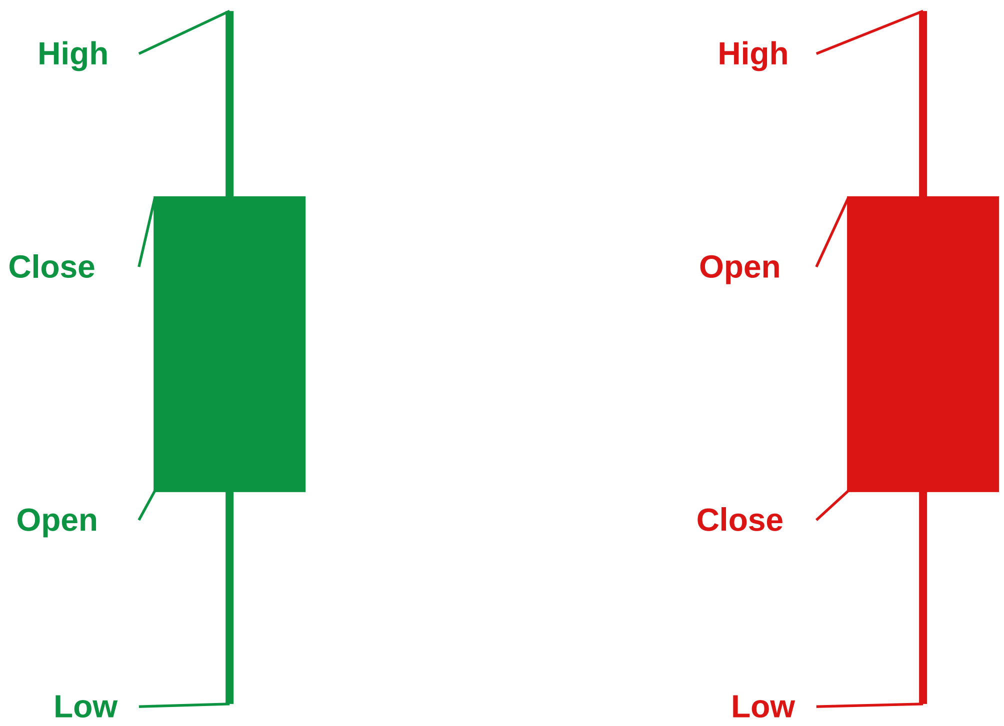
If you feel panic, revenge, or FOMO, step away. Emotion turns small mistakes into expensive ones.

OK Dummy rule

The market will still be there tomorrow. You do not need to chase today.

Candlesticks Explained Simply

A candle is a compact picture of what price did during one selected period.



Beginner rule

!

Do not trade from one candle alone. A candle matters most when it appears at support, resistance, or a trendline.

Support and Resistance Zones

Support is where buyers may step in. Resistance is where sellers may step in. Think zones, not perfect lines.

S

Support

A possible area to look for buyers. It can break, so risk still matters.

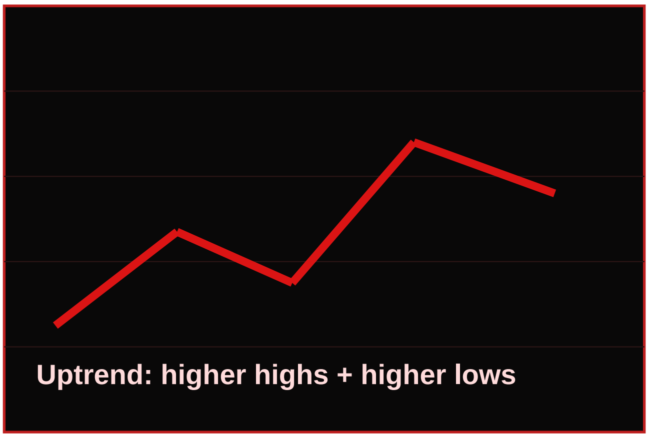
R

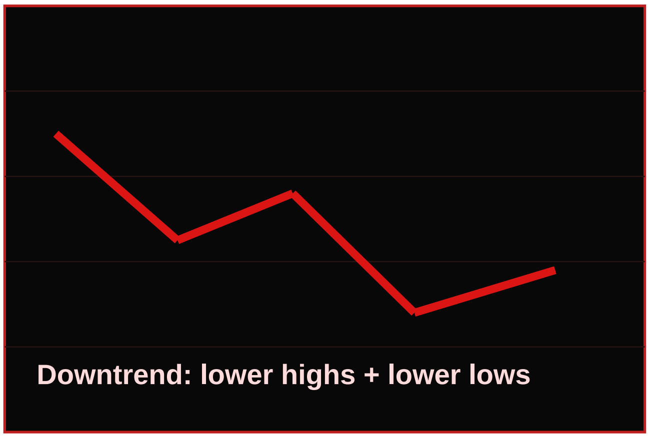
Resistance

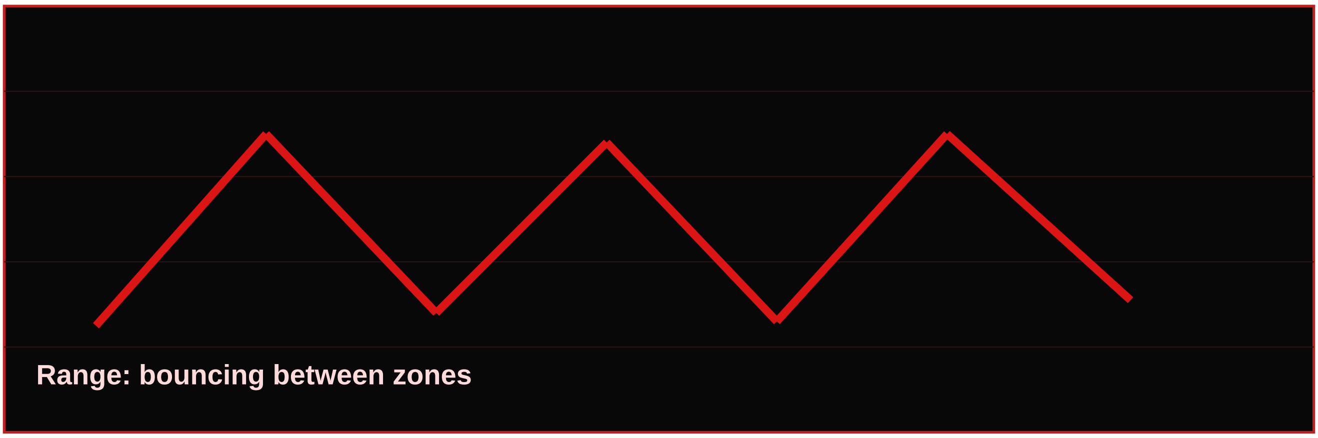
A possible area to take profit, avoid chasing, or watch for rejection.

Trends: Up, Down, or Sideways?

Before entries, ask what the market is doing overall.







!

Beginner rule

If you cannot tell whether the chart is trending or ranging, do not trade yet.
First label the market condition.

Timeframes Without Confusion

Start big, then zoom in. Do not jump around until you find an excuse to enter.

1 **Higher timeframe**

Daily or 4-hour. Use this for the big direction: uptrend, downtrend, or range.

2 **Planning timeframe**

4-hour or 1-hour. Mark zones and decide where a setup would make sense.

3 **Entry timeframe**

1-hour or 15-minute. Use only after the bigger plan is already clear.

X **Bad habit**

A beginner sees a bearish daily chart, then zooms into a tiny 5-minute bounce and buys anyway. That is not analysis. That is searching for permission.

OK **Simple routine**

Check the daily or 4-hour first. If the big picture is unclear, stop. If it is clear, mark zones and then consider lower-timeframe confirmation.

Indicators: Helpful, Not Magic

Volume, moving averages, and RSI can support a plan, but they should not replace market structure.

V

Volume

Shows how much trading happened. A breakout with stronger volume can be more meaningful than a weak, low-volume breakout.

MA

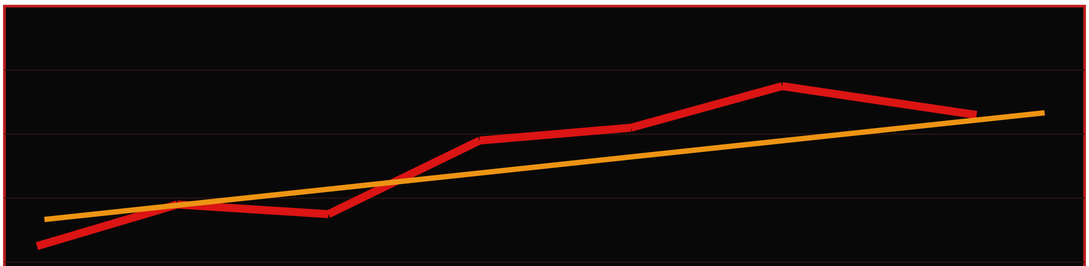
Moving averages

Smooth price. Price above major averages can suggest bullish structure; below them can suggest bearish structure.

R

RSI

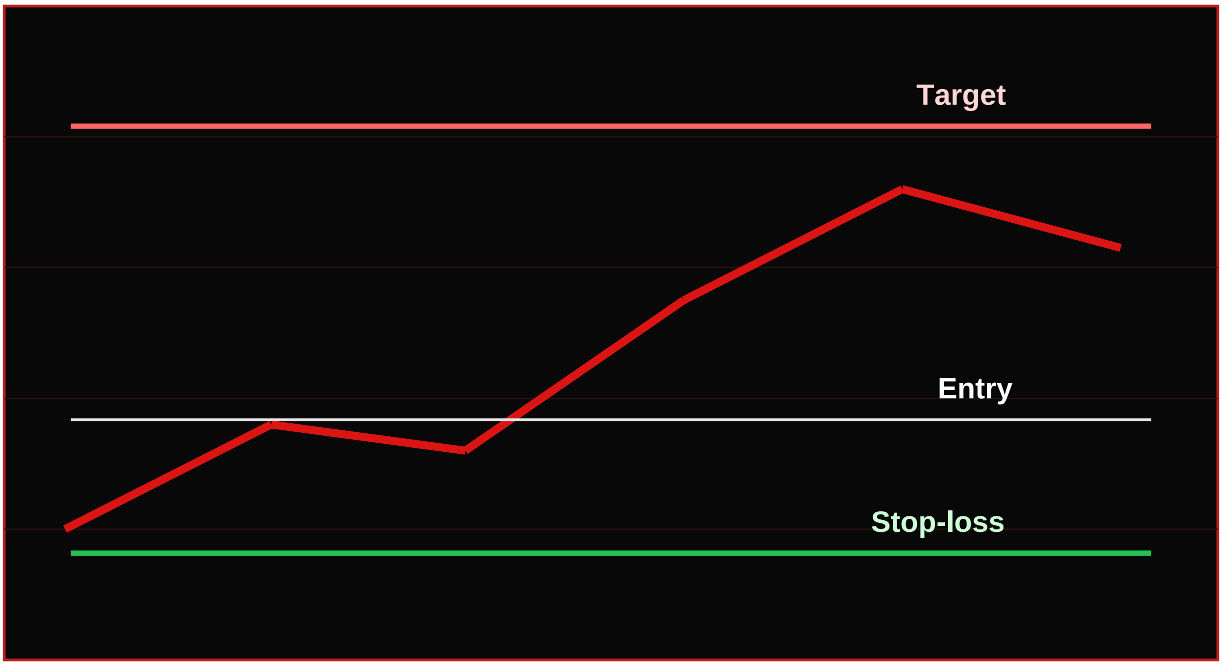
Measures momentum. Above 70 can be overextended; below 30 can be oversold. Neither is a standalone buy or sell signal.



Price line + simple moving average example

The Most Important Part: Risk

Beginners obsess over entries. Survivors obsess over how much they can lose if wrong.



EUR

Example

Account: EUR 1,000. Risk: 1%.
Maximum planned loss: EUR 10.

!

Key idea

The stop-loss helps decide how big the position can be.

OK

Rule

A good trade is not one that must win. A good trade is one where the loss is controlled before you enter.

Position Sizing Made Simple

Risk is money, not feelings. Decide the maximum planned loss before the trade.

1

Step 1: choose account risk

Example: EUR 1,000 account and 1% risk. That means the maximum planned loss is EUR 10.

2

Step 2: measure stop distance

If entry is EUR 100 and stop-loss is EUR 95, the stop distance is EUR 5 per coin/token.

3

Step 3: calculate size

Position size = money risked / stop distance. EUR 10 / EUR 5 = 2 units.

Formula: position size = money risked / stop distance

Smaller risk keeps your brain calmer and your account alive.

Example: A Planned Long Setup

Fictional and simplified. The point is the structure, not a prediction.

1. 4H trend is up
2. Price pulls back to support
3. Candle rejects and closes above zone
4. Stop goes below the zone
5. Target is next resistance
6. Risk is limited to 1%

Example: When to Skip a Trade

A missed trade is not a loss. A forced trade can become one.

1 Price already pumped

If you are buying only because a huge candle happened, you are probably late.

2 No clear level

If you cannot identify support, resistance, or invalidation, there is no plan.

3 Bad risk/reward

If the stop is far and the target is close, the setup may not be worth it.

4 Emotional state

If you are angry, scared, or desperate to win back money, step away.

5 Social signal only

Copying strangers online without your own plan is not a process.

6 Too much size

If the loss would hurt badly, the position is too big.

OK Dummy rule

Skipping bad trades is one of the fastest ways to improve.

How Felix Crypto Edge Helps

Use the tool as a training wheel for process, not as a profit machine.

1 **Trend**
Is price moving up, down, or sideways?

2 **Zones**
Where did price react before?

3 **Risk**
Where is the idea wrong?

! **Important**
Good tool output should make you slower and more structured, not reckless.

Beginner Checklist Before Any Trade

If you cannot answer these questions, skip the trade. Skipping bad trades is a skill.

1 **What coin?**

6 **Why this entry?**

2 **What timeframe?**

7 **Where is stop-loss?**

3 **Trending or ranging?**

8 **Where is target?**

4 **Where is support?**

9 **How much risk?**

5 **Where is resistance?**

10 **Calm or chasing?**

OK **Final rule**

The goal is not to trade more. The goal is to trade better, smaller, and with a clear reason.

Mistakes That Destroy Beginners

Avoiding these mistakes can be more valuable than finding another indicator.

1 FOMO buying

Jumping in after a huge green candle because you feel left behind.

2 No stop-loss

Refusing to decide where the trade idea is wrong.

3 Too much size

Risking so much that one normal loss hurts badly.

4 Signal chasing

Blindly copying strangers online without your own plan.

5 Revenge trading

Trying to win money back immediately after losing.

6 Indicator overload

Making the chart so messy that you cannot think clearly.

OK Dummy rule

The tool supports learning. It does not remove risk.

Mini Glossary, Part 1

Plain-English definitions for beginner chart reading.

Altcoin

Any crypto asset that is not Bitcoin.

Breakout

Price moving beyond a support or resistance area.

Confirmation

Extra evidence before entry, such as a candle close above a level.

FOMO

Fear of missing out; chasing because price is moving fast.

Liquidity

How easily an asset can be bought or sold.

Long

A trade that benefits if price rises.

Pullback

A temporary move against the trend.

Mini Glossary, Part 2

Plain-English definitions for beginner chart reading.

Range

Sideways market between support and resistance.

Resistance

Area where price may struggle to move higher.

Risk/reward

Comparison between possible loss and possible profit.

Short

A trade that benefits if price falls; risky for beginners.

Stop-loss

Planned exit if the trade idea is wrong.

Support

Area where price may stop falling or bounce.

Volatility

How fast and strongly price moves.

7-Day Practice Plan

Practice on charts before risking real money. The goal is pattern recognition and discipline.

Day 1	Label open, high, low, and close on 20 candles.
Day 2	Mark three support zones and three resistance zones on BTC.
Day 3	Label uptrend, downtrend, or range on 10 charts.
Day 4	Write entry, stop-loss, and target for practice setups.
Day 5	Calculate position size for five fictional trades.
Day 6	Review mistakes and identify your most likely weakness.
Day 7	Build a one-page checklist and follow it every time.

You do not need magic signals.
You need a repeatable process.

Felix Crypto Edge is built to help beginners slow down, read charts clearly, understand risk, and learn why a setup might make sense.

Education only. Not financial advice.

Crypto trading is risky. You can lose money. Always use your own judgment and manage risk.
