Important Disclaimer

This guide is for education only. It is not financial advice, investment advice, or a guarantee of profit. Crypto trading is risky. Prices can move quickly, and you can lose money. Always do your own research, use risk management, and never trade money you cannot afford to lose.

Table of Contents

1. What Crypto Trading Really Is

Crypto trading is the act of buying and selling digital assets such as Bitcoin, Ethereum, Solana, or other coins with the goal of taking advantage of price movement.

Many beginners think trading is about guessing whether price will go up or down. That is the wrong approach.

Good trading is about building a repeatable process:

? Where is the market trending?
? Where did price previously react?
? What area gives a reasonable entry?
? Where is the trade idea wrong?
? How much can be lost if the trade fails?
? Is the possible reward worth the risk?

You do not need to be right every time. You need a process that protects you when you are wrong.

2. The Beginner Mindset

Most new traders lose because they rush. They see a coin pumping, feel fear of missing out, and buy too late. Then when price drops, they panic and sell.

A beginner should focus on three things first:

1. Survival - do not blow up your account.
2. Structure - follow the same process every time.
3. Learning - review trades and improve gradually.

A useful rule: if you cannot explain why you are entering, where you are wrong, and where you would take profit, you do not have a trade plan.

3. Candlesticks Explained Simply

A candle shows price movement over a selected time period.

Each candle has:

? **Open** - where price started.
? **Close** - where price ended.
? **High** - the highest price reached.
? **Low** - the lowest price reached.
? **Body** - the difference between open and close.
? **Wick** - price movement above or below the body.

A green candle usually means price closed higher than it opened. A red candle usually means price closed lower than it opened.

Big candles show strong movement. Long wicks can show rejection, where price moved into an area but could not stay there.

Do not use a single candle alone. Candles matter more when they appear at important areas like support, resistance, or trendlines.

4. Support and Resistance

Support is an area where price has previously stopped falling or bounced upward.

Resistance is an area where price has previously stopped rising or rejected downward.

These are not perfect lines. They are zones.

A support zone might be useful because buyers previously showed interest there. A resistance zone might matter because sellers previously stepped in there.

Beginners often make two mistakes:

? Drawing too many levels.
? Treating levels as guaranteed.

Support can break. Resistance can break. The job is not to predict perfectly. The job is to identify areas where a trade idea may make sense, then manage risk.

5. Trends and Market Structure

A market can generally be in one of three states:

1. Uptrend - price makes higher highs and higher lows.
2. Downtrend - price makes lower highs and lower lows.
3. Range - price moves sideways between support and resistance.

In an uptrend, beginners often look for pullbacks toward support or moving averages. In a downtrend, buying is riskier because price may keep falling.

A simple beginner rule: do not fight the trend until you understand reversal setups.

6. Indicators: Moving Averages and RSI

Indicators are tools. They are not magic.

Moving Averages

A moving average smooths price over time. Common examples include the 20-period, 50-period, and 200-period moving averages.

Possible beginner uses:

? Price above major moving averages can suggest bullish structure.
? Price below major moving averages can suggest bearish structure.
? Moving averages can act as dynamic support or resistance.

RSI

RSI stands for Relative Strength Index. It measures momentum.

Common beginner interpretation:

? RSI above 70 may mean price is overextended.
? RSI below 30 may mean price is oversold.
? RSI near the middle is often neutral.

Do not buy only because RSI is low. Do not sell only because RSI is high. Use indicators with market structure.

7. Entry, Exit, Stop-Loss, and Risk

A trade plan needs four parts:

1. Entry - where you enter.
2. Stop-loss - where you exit if wrong.
3. Target - where you may take profit.
4. Position size - how much you risk.

Risk management is more important than finding perfect entries.

Example:

? Account size: EUR1,000
? Risk per trade: 1%

? Maximum loss allowed: EUR10

If your stop-loss is far away, your position size must be smaller. Beginners often lose because they use too much size.

A simple rule: risk small enough that one losing trade does not emotionally damage you.

8. Example Trade Setup Process

Here is a simple educational process:

1. Choose a major coin such as BTC or ETH.
2. Check the higher timeframe trend.
3. Mark obvious support and resistance zones.
4. Wait for price to approach a zone.
5. Look for confirmation, such as rejection, a break of structure, or momentum change.
6. Define entry, stop-loss, and target.
7. Check if the reward is worth the risk.
8. Take the trade only if the plan is clear.
9. Review the result afterward.

The goal is not to trade constantly. The goal is to wait for better areas.

9. Common Beginner Mistakes

Avoid these:

? Buying after a huge pump because of fear of missing out.
? Trading with no stop-loss.
? Risking too much on one trade.
? Taking random signals from social media.
? Using too many indicators.
? Revenge trading after a loss.
? Moving the stop-loss because you do not want to be wrong.
? Thinking a tool can guarantee profits.

A tool can help with structure, but discipline still matters.

10. How to Use the Felix Crypto Edge Tool

The Felix Crypto Edge tool is designed to help beginners analyze charts more clearly.

The tool may highlight:

? Possible support zones.
? Possible resistance zones.
? Trend direction.
? Momentum conditions.
? Educational buy and sell zones.
? Risk reminders.

These zones are not commands. They are learning aids.

When the tool marks a possible buy zone, ask:

? Is the higher timeframe trend supportive?
? Is price near support?
? Where would this idea be invalid?
? Is there enough upside compared to the risk?

When the tool marks a possible sell zone, ask:

? Is price near resistance?
? Is momentum weakening?
? Am I taking profit or opening a risky short?
? What would prove this idea wrong?

Use the tool to slow down and think, not to blindly click buy or sell.

11. Trading Checklist

Before entering any trade, answer:

? What coin am I trading?
? What timeframe am I using?
? What is the trend?
? Where is support?
? Where is resistance?
? Why is this entry area interesting?
? Where is my stop-loss?

? What is my target?
? How much money am I risking?
? Is the reward worth the risk?
? Am I calm, or am I chasing?

If you cannot answer these clearly, skip the trade.

Final Word

Crypto markets can create opportunity, but they can also punish impatience. The beginner advantage is not prediction. It is discipline.

Learn the basics. Use a clear process. Protect your capital. Treat every trade as practice in decision-making.

Felix Crypto Edge exists to help beginners build that process.
